QI What do you understood by Asymphotic notations. Define different Asymphotic notation with example?

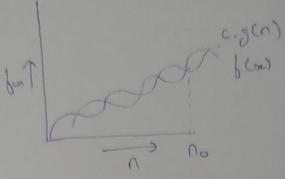

Ansl Asymptotic notation are the methendical notation used to describe the running time of an algorithm when the input took towards a particular value or a limiting value. Asymptotic towards a particular value or a limiting value. Asymptotic Notation is a way to compare function that ignares constant pates, and small input sizes.

Types of Asymphotic Notchions +

- (1) Big Theta (0) -> Tight bound, complexity represented is like average value or rarge within which the actual time of execution will be.
- (D) Big Dh (O) This is used for upper bound of algorithm
 or worst Case of an algorithm. It tells that a function will
 never exceed specified the for any value of input n.

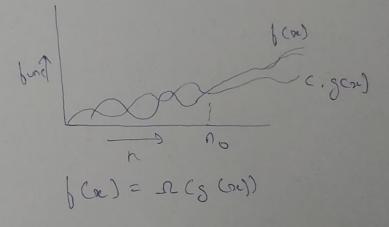

B) Big Omega (II) is used to define lower bound of any algorithm or the best care of a degrithm.

1 Big OH (0) >

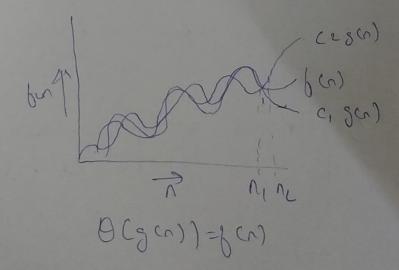

b(n) = O(8 (n)) g (n) is fight upper bound

2 Big Omega (I)

3 Theba (0): - Gives both upper and lower bound
